### **Features**

- High-performance, Low-power Atmel<sup>®</sup> AVR<sup>®</sup> 8-bit Microcontroller
- Advanced RISC Architecture
  - 131 Powerful Instructions Most Single-clock Cycle Execution
  - 32 x 8 General Purpose Working Registers
  - Fully Static Operation
  - Up to 20MIPS Throughput at 20MHz
  - On-chip 2-cycle Multiplier
- High Endurance Non-volatile Memory segments
  - 16/32/64/128KBytes of In-System Self-programmable Flash program memory
  - 512/1K/2K/4KBytes EEPROM
  - 1/2/4/16KBytes Internal SRAM
  - Write/Erase Cycles: 10,000 Flash/ 100,000 EEPROM
  - Data retention: 20 years at 85°C/ 100 years at 25°C<sup>(1)</sup>
  - Optional Boot Code Section with Independent Lock Bits In-System Programming by On-chip Boot Program True Read-While-Write Operation
  - Programming Lock for Software Security
- QTouch® library support
  - Capacitive touch buttons, sliders and wheels
  - QTouch and QMatrix acquisition
  - Up to 64 sense channels
- JTAG (IEEE std. 1149.1 Compliant) Interface
  - Boundary-scan Capabilities According to the JTAG Standard
  - Extensive On-chip Debug Support
  - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescalers and Compare Modes
  - One/two 16-bit Timer/Counter with Separate Prescaler, Compare Mode, and Capture Mode
  - Real Time Counter with Separate Oscillator
  - Six PWM Channels
  - 8-channel, 10-bit ADC

Differential mode with selectable gain at 1x, 10x or 200x

- Byte-oriented Two-wire Serial Interface
- Two Programmable Serial USART
- Master/Slave SPI Serial Interface
- Programmable Watchdog Timer with Separate On-chip Oscillator
- On-chip Analog Comparator
- Interrupt and Wake-up on Pin Change
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated RC Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby and Extended Standby
- I/O and Packages
  - 32 Programmable I/O Lines
  - 40-pin PDIP, 44-lead TQFP, 44-pad VQFN/QFN/MLF
  - 44-pad DRQFN
  - 49-ball VFBGA
- Operating Voltages
  - 1.8 5.5V
- Speed Grades
  - 0 4MHz @ 1.8 5.5V
  - 0 10MHz @ 2.7 5.5V
  - 0 20MHz @ 4.5 5.5V
- Power Consumption at 1MHz, 1.8V, 25°C
  - Active: 0.4mA
  - Power-down Mode: 0.1µA
  - Power-save Mode: 0.6µA (Including 32kHz RTC)

## 2. Overview

The ATmega164A/164PA/324A/324PA/644A/644PA/1284P is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

## 2.1 Block Diagram

Figure 2-1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega164A/164PA/324A/324PA/644A/644PA/1284P provide the following features:

16/32/64/128Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 512/1K/2K/4Kbytes EEPROM, 1/2/4/16Kbytes SRAM, 32 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), three flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented 2-wire Serial Interface, a 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

Atmel offers the QTouch® library for embedding capacitive touch buttons, sliders and wheels functionality into AVR microcontrollers. The patented charge-transfer signal acquisition offers robust sensing and includes fully debounced reporting of touch keys and includes Adjacent Key Suppression® (AKS™) technology for unambiguous detection of key events. The easy-to-use QTouch Suite toolchain allows you to explore, develop and debug your own touch applications.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The Onchip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega164A/164PA/324A/324PA/644PA/1284/1284P is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

## 2.3 Pin Descriptions

### 2.3.1 VCC

Digital supply voltage.

#### 2.3.2 GND

Ground.

### 2.3.3 Port A (PA7:PA0)

Port A serves as analog inputs to the Analog-to-digital Converter.

Port A also serves as an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega164A/164PA/324A/324PA/644PA/1284/1284P as listed on page 80.

### 2.3.4 Port B (PB7:PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega164A/164PA/324A/324PA/644PA/1284/1284P as listed on page 82.

### 2.3.5 Port C (PC7:PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source

capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of the JTAG interface, along with special features of the ATmega164A/164PA/324A/324PA/644PA/1284/1284P as listed on page 85.

### 2.3.6 Port D (PD7:PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega164A/164PA/324A/324PA/644PA/1284/1284P as listed on page 88.

### 2.3.7 **RESET**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in "System and Reset Characteristics" on page 337. Shorter pulses are not guaranteed to generate a reset.

### 2.3.8 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

### 2.3.9 XTAL2

Output from the inverting Oscillator amplifier.

### 2.3.10 AVCC

AVCC is the supply voltage pin for Port A and the Analog-to-digital Converter. It should be externally connected to  $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to  $V_{CC}$  through a low-pass filter.

#### 2.3.11 AREF

This is the analog reference pin for the Analog-to-digital Converter.

### 3. Resources

A comprehensive set of development tools, application notes and datasheets are available for download on http://www.atmel.com/avr.

## 4. About Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

The code examples assume that the part specific header file is included before compilation. For I/O registers located in extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR".

### 5. Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

## 6. Capacitive touch sensing

The Atmel<sup>®</sup> QTouch<sup>®</sup> Library provides a simple to use solution to realize touch sensitive interfaces on most Atmel AVR<sup>®</sup> microcontrollers. The QTouch Library includes support for the QTouch and QMatrix<sup>®</sup> acquisition methods.

Touch sensing can be added to any application by linking the appropriate Atmel QTouch Library for the AVR Microcontroller. This is done by using a simple set of APIs to define the touch channels and sensors, and then calling the touch sensing API's to retrieve the channel information and determine the touch sensor states.

The QTouch Library is FREE and downloadable from the Atmel website at the following location: www.atmel.com/qtouchlibrary. For implementation details and other information, refer to the Atmel QTouch Library User Guide - also available for download from the Atmel website.

Notes: 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

- 2. I/O registers within the address range \$00 \$1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses \$00 \$3F must be used. When addressing I/O registers as data space using LD and ST instructions, \$20 must be added to these addresses.

  The ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from \$60 \$FF, only the ST/STS/STD and LD/LDS/LDD instructions can be used.
- 5. USART in SPI Master Mode.
- 6. Only available in the ATmega164PA/324PA/644PA/1284P.

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

### 12.1 Rev. 8272C - 06/11

Updated "ATmega1284P DC Characteristics" on page 334.

#### 12.2 Rev. 8272B - 05/11

- 1. Added Atmel QTouch Library Support and QTouch Sensing Capability Features.
- 2. Replaced Figure 1-1 on page 2 by an updated "Pinout" that includes Timer/Counter3.
- 3. Replaced Figure 7-1 on page 10 by an updated "Block Diagram of the AVR Architecture" that includes Timer/Counter3.
- Added "RAMPZ Extended Z-pointer Register for ELPM/SPM<sup>(1)</sup>" on page 15.
- 5. Added "PRR1 Power Reduction Register 1" on page 49.
- 6. Renamed PRR to "PRR0 Power Reduction Register 0" on page 48.
- 7. Updated "PCIFR Pin Change Interrupt Flag Register" on page 69. PCICR replaces EIMSR in the PCIF3, PCIF2, PCIF1 and PCIF0 bit description.
- 8. Updated "PCMSK3 Pin Change Mask Register 3" on page 70. PCIE3 replaces PCIE2 in the bit description.
- 9. Updated "Alternate Functions of Port B" on page 82 to include Timer/Counter3
- 10. Updated "Alternate Functions of Port D" on page 88 to include Timer/Counter3
- 11. Added "TCNT3H and TCNT3L -Timer/Counter3" on page 136
- 12. Added "OCR3AH and OCR3AL Output Compare Register3 A" on page 137
- 13. Added "OCR3BH and OCR3BL Output Compare Register3 B" on page 137
- 14. Added "TIMSK3 Timer/Counter3 Interrupt Mask Register" on page 139
- 15. Updated All "SPI Serial Peripheral Interface" "Register Description" to reflect ATmega1284 and ATmega1284P.
- Updated "Addressing the Flash During Self-Programming" on page 284 to include RAMPZ register.
- 17. Updated Table 27-16 on page 314.  $t_{\rm WD\ EEPROM}$  is 3.6ms instead of 9ms.
- 18. BODS and BODSE bits denoted as R/W
- 19. Description of external pin modes below table 16-9 removed.
- 20. Updated "Register Summary" on page 10 to include Timer/Counter3.
- 21. Updated the datasheet with Atmel new style guide.

### 12.3 Rev. 8272A - 01/10

- Initial revision (Based on ATmega164PA/324PA/644PA/1284P datasheet 8252G-AVR-11/09 and on ATmega644 datasheet 2593N-AVR-09/09).
- 2. Changes done:
  - Non-picoPower devices added: ATmega164A/324A/644A/1284
  - Updated Table 2-1 on page 7
  - Updated Table 10-1 on page 42
  - Updated "Sleep Modes" on page 42 and "BOD Disable(1)" on page 43
  - Updated "Register Description" on page 67
  - Updated "USART" on page 174 and "USART in SPI Mode" on page 201
  - Updated "Signature Bytes" on page 300 and "Page Size" on page 300
  - Added "DC Characteristics" on page 329 for non-picoPower devices.
  - Added "ATmega164A Typical Characteristics" on page 345
  - Added "ATmega324A Typical Characteristics" on page 397
  - Added "ATmega644A Typical Characteristics" on page 449
  - Added "ATmega1284 Typical Characteristics" on page 501
  - Added "Ordering Information" on page 17 for non-picoPower devices
  - Added "Errata for ATmega164A" on page 30
  - Added "Errata for ATmega324A" on page 30
  - Added "Errata for ATmega644PA" on page 30
  - Added "Errata for ATmega1284" on page 30
